## Operations on Vectors 15.3

The sum of two vectors is called the $\qquad$ .

| End to End method |  |  |  |  |  | $y_{4}$ |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\vec{u}=\langle 5,4\rangle$ and $\vec{v}=\langle 2,-9\rangle$, find $\vec{u}+\vec{v}$. |  |  |  |  |  | 6 |  |  |  |  |  |  |
| $\vec{u}=\langle 5,4\rangle$ and $\vec{v}=\langle 2,-9\rangle$, find $\vec{u}+\vec{v}$. |  |  |  |  |  | 5 |  |  |  |  |  |  |
|  |  |  |  |  |  | 4 |  |  |  |  |  |  |
| 1. Position $u$ and $v$ so that the terminal |  |  |  |  |  | 3 |  |  |  |  |  |  |
| point of $u$ coincides with the initial point |  |  |  |  |  | 2 |  |  |  |  |  |  |
| of $v$. |  |  |  |  |  | 1 |  |  |  |  |  |  |
| 2. The resultant vector, $u+v$, extends from | $\stackrel{-6}{ }$ |  | -4-3 | - -2 | -1 | $1{ }^{0}$ |  | 2 | 3 | 4 | ${ }_{56}{ }^{x}$ |  |
| the initial point of $u$ to the terminal point |  |  |  |  |  | -1 |  |  |  |  |  |  |
| of v . |  |  |  |  |  | -2 |  |  |  |  |  |  |

|  |  |  |  |  |  | 5 |  |  |  |  |  |  |
|  |  |  |  |  |  | $\downarrow$ |  |  |  |  |  |  |
| Component Wise method $\vec{u}=\langle 5,4\rangle$ and $\vec{v}=\langle 2,-9\rangle$, find $\vec{u}+\vec{v}$. |  |  |  |  |  |  |  |  |  |  |  |  |
| 1. Add horizontal components <br> 2. Add vertical components |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  | 54 |  |  |  |  |  |  |
| $\vec{u}=\langle 5,4\rangle$ and $\vec{v}=\langle 2,-9\rangle$, find $\vec{u}+\vec{v}$. |  |  |  |  |  | 6 |  |  |  |  |  |  |
|  |  |  |  |  |  | 5 |  |  |  |  |  |  |
|  |  |  |  |  |  | 4 |  |  |  |  |  |  |
| 1. Draw both vectors starting at a common |  |  |  |  |  | 3 |  |  |  |  |  |  |
| point, forming two sides of a |  |  |  |  |  | 2 |  |  |  |  |  |  |
| parallelogram. |  |  |  |  |  | 1 |  |  |  |  |  |  |
| 2. Draw the other two sides. | $\stackrel{4}{-6}$ | -5-4 | -4-3 | -2 | -1 | 0 | 12 | 2 | 3 | 45 | $\xrightarrow[6]{ }$ |  |
| 3. Draw in a new vector from the common |  |  |  |  |  | -1 |  |  |  |  |  |  |
| starting point to the opposite vertex of |  |  |  |  |  | -2 |  |  |  |  |  |  |
|  |  |  |  |  |  | ${ }^{-3}$ |  |  |  |  |  |  |
| the parallelogram. |  |  |  |  |  | ${ }^{-4}$ |  |  |  |  |  |  |
|  |  |  |  |  |  | -5 |  |  |  |  |  |  |
|  |  |  |  |  |  | $\downarrow$ |  |  |  |  |  |  |

## Magnitudes and Vector Addition

| The magnitude of the sum of two vectors is not <br> equal to the sum of the magnitudes of the two <br> vectors $\\|u+v\\| \neq\\|u\\|+\\|v\\|$. | $\vec{u}=\langle 5,4\rangle$ and $\vec{v}=\langle 2,-9\rangle$, find |
| :--- | :--- |
|  | $\\|u+v\\|=$ |
|  | $\\|u\\|+\\|v\\|=$ |

## Subtracting Vectors

Multiply a vector by a scalar

We can stretch a vector by multiplying the vector by a scale factor. For example, $2 \vec{v}$ represents the vector that has the same direction as $\vec{v}$, but whose magnitude is twice that of $\vec{v}$.
If $v=\langle 5,4\rangle$ find:
$6 v$
and
$-3 v$

Scalar multiplication and magnitude

When multiplying a vector by a scalar the magnitude of $k v$ ( $k$ is the scalar, $v$ is the vector) is the magnitude of the vector times the absolute value of the scalar.

Find the magnitude of
$6 v$
and
$-3 v$
